Barrel Length Accuracy And Muzzle

Fact: In no part of our testing was barrel length a determining factor in accuracy. At a distance of 100-540 yards, there was no discernible difference in accuracy between various barrel lengths. This performance translated over to unknown distance shooting with all barrel lengths at ranges out to 900 yards.

The Truth About Barrel Length, Muzzle Velocity and Accuracy

Barrel length does affect accuracy, muzzle velocity and delivered energy when testing various classes of rimfire ammo. But other variables tend to play a major role as well. What Does Barrel Length Affect: Concerning accuracy, all lengths proved accurate to a certain extent when match with the right ammo.

How Does Barrel Length Affect Accuracy And Ballistics ...

The longest the barrel is, better is the accuracy and higher is the muzzle velocity. I guess you already heard that falseaffirmation. Accuracy is directly related to barrel stiffness. For a given diameter and caliber, longer a barrel is, lesser it is stiff.

What You Need To Know About Barrel Length And Velocity: The assumed 25 fps velocity increase per inch of barrel, in most cases, proves a wife's tale. Tests on barrel length/velocity are often very limited in scope and overall add up to simple guesses. Other factors — chamber dimension, bore dimension — also play a role in velocity.

Selecting the best barrel length for the .300 BLK can be a double-edged sword. At 10-inches, muzzle velocity hasn't reached its peak. Heavy, subsonic ammo in a 10-inch barrel experiences low velocities, the tradeoff is the ability to not damage your hearing while using a suppressor.

These are useful all-around barrel lengths for such cartridges. The highest velocity standard cartridges (.243,.25-06,.270 Win.), which achieve muzzle velocities around 3000 fps, are at their best in a 24 inch barrel and 24 inches is the SAAMI standard for almost all American centerfire rifle calibers.

It just isn't going to make a significant difference with production rifles and 2" of barrel length. My suggestion would be a heavier bullet and increase the charge to the maximum accuracy would allow. The barrel length difference in handguns from 3" to 6" is marginal to accuracy - it matters, but not that much, or at least not enough for even a very good marksman to see. What matters is sight radius for accuracy. I've seen pros use 3".45's with heavy 230gr. bullets shoot as well as other pros with 6" barreled.45's shooting the same load.
