Health Psychology: Biopsychosocial Interactions by Edward ...

9Biopsychosocial Interactions. The factors we have considered so far—including selectivity, socioeconomic status, health behaviors, prejudice and discrimination, social support, and stress—are typically studied independently, often within the boundaries of separate disciplines. Yet a good deal of research indicates that these factors do not affect health independently but interact among themselves and with biological systems.

The biopsychosocial model is an interdisciplinary model that looks at the interconnection between biology, psychology, and socio-environmental factors. The model specifically examines how these aspects play a role in topics ranging from health and disease models to human development. This model was developed by George L. Engel in 1977 and is the first of its kind
