Problem 1 An object moves from point A to point B to point C, then back to point B and then to point C along the line shown in the figure below. a) Find the distance covered by the moving object. b) Find the magnitude and direction of the displacement of the object. Solution to Problem 1. Problem 2

In physics terms, you'll often see displacement referred to as the variable s . In this case, $s = +3$ meters. Like any other measurement in physics, displacement is always expressed in units, usually centimeters or meters, as in this example.

Problems in Linear Motion - Distance and displacement 1. A car travels along a straight road 100 m east then 50 m west. Find distance and displacement of the car. Solution. Distance is $100 \text{ meters} + 50 \text{ meters} = 150 \text{ meters}$. Displacement is $100 \text{ meters} - 50 \text{ meters} = 50 \text{ meters}$, to the east.

Distance and displacement - problems and solutions ...

In physics, you find displacement by calculating the distance between an object's initial position and its final position. In physics terms, you often see displacement referred to as the variable s . The official displacement formula is as follows: $s = s_f - s_i$.
 $s =$ displacement; $s_i =$

Distance and

displacement are two quantities that seem to mean the same but are distinctly different with different meanings and definitions. Distance is the measure of “how much ground an object has covered during its motion” while displacement refers to the measure of “how far out of place is an object.”
