A finite-state machine (FSM) or finite-state automaton (FSA, plural: automata), finite automaton, or simply a state machine, is a mathematical model of computation. It is an abstract machine that can be in exactly one of a finite number of states at any given time. The FSM can change from one state to another in response to some inputs; the change from one state to another is called a transition.

Finite automata are used to recognize patterns. It takes the string of symbol as input and changes its state accordingly. When the desired symbol is found, then the transition occurs. At the time of transition, the automata can either move to the next state or stay in the same state.

A Boolean-valued function (sometimes called a predicate or a proposition) is a function of the type  $f : X \rightarrow B$ , where  $X$  is an arbitrary set and where  $B$  is a Boolean domain, i.e. a generic two-element set, (for example  $B = \{0, 1\}$ ), whose elements are interpreted as logical values, for example,  $0 = \text{false}$  and  $1 = \text{true}$ , i.e., a single bit of information.. In the formal sciences, mathematics ...
