Wind Farms A wind farm is a collection of wind turbines in the same location. Wind turbines are often grouped together in wind farms because this is the most economical way to create electricity from the wind. If multiple wind

Offshore wind turbines must be designed for ocean conditions. Wind turbines rarely run at full capacity since their energy generation is weather-dependent. In addition to wind turbines, a wind farm requires an electrical power collection system, transformers, a communications network, and substations.

The MV electrical network takes the power to a central point (or several points, for a large wind farm). A typical layout is shown in Figure 4.8. In this case the central point is also a transformer substation, where the voltage is stepped up again to high voltage (HV, typically 100 to 150 kV) for
